# Private native forest resource

## About the information sheets

This series describes the extent and condition of the private native forest resource across Queensland and northern NSW.

The series is a result of a research project that captures the productive capacity of private native forests in relation to more effective management practices. The research also documents the environmental benefits that can be achieved from sustainable forest management.

The series represents an information resource for anyone interested or engaged in sustainable forest management, timber production and associated grazing opportunities.

For each region, the information sheets describe:

- Areas of potentially harvestable forest (mapping the extent of remnant, regrowth and woody, non-remnant forest)
- Common forest types
- Options for timber and grazing production
- Forest productivity (merchantable volume and carbon stocks and improving forest productivity)
- Ecological benefits and condition

The information sheets were produced by the project 'Improving productivity of the sub-tropical private native forest resource' conducted by the Department of Agriculture and Fisheries with industry and university collaborators. The project was funded by the Department of Agriculture and Fisheries and Forest and Wood Products Australia.
